## Divergence-free DG schemes for hyperbolic problems

*Abstract:*

We discuss an approach for constructing DG methods for hyperbolic problems which automatically ensures the divergence-free condition. The approximation is based on the use of Raviart-Thomas polynomial spaces for approximating vector fields. The methods require multi-dimensional Riemann solvers to ensure the divergence-free property. We will discuss HLL-type multi-dimensional Riemann solvers to estimate the electric field at vertices which are consistent with the 1-D Riemann solvers. When limiters are used, the divergence-free property may be lost and it is recovered by a divergence-free reconstruction step. We show the performance of the method on a range of test cases up to fourth order of accuracy.
